

Project title :Implementation Client Script UI Policy

Phase 2: Requirement Analysis phase

1. Functional Requirements (FR)

FR-1: The system must listen to the Impact field on the Incident form in real time.

- FR-2: When Impact is set to "1 - High", the Assignment group field must dynamically become mandatory.
- FR-3: When Impact is set to "1 - High", the Urgency field must be forced to "1 - High" automatically and rendered read-only.
- FR-4: The system must prevent submission of a High-Impact incident if the Assigned to field is left empty.
- FR-5: Direct inline editing of the State field from the Incident list view must be strictly blocked with an explanatory alert message.
- FR-6: Form configurations must reverse smoothly if the incident Impact value drops below High.

2. Non-Functional Requirements (NFR)

- Performance: Client-side execution should be immediate, adding negligible overhead to form loading times.
- Usability: Validation errors and information banners must clearly guide the user on what correction is needed.

- Compatibility: Scripts must run across standard desktop web browsers supported by the ServiceNow platform.
