

Project title: Implementation Client Script & UI Policy

Phase 7: Project Documentation Phase

1. Project Documentation Phase

Final Deployment Assets The implementation package consists of the following components developed on the Incident (incident) table scope:

- 1 UI Policy Record: Contains conditional parameters checking impact level properties.
- 1 UI Policy Action Record: Contains read-only properties applied directly to the urgency column.
- 3 Client Script Configurations: Handles real-time form actions (onChange), validation checks (onSubmit), and inline controls (onCellEdit).

2. Maintenance Guidelines

- Policy Order Control: Ensure the UI Policy Order is kept at its default or adjusted properly if other policies conflict on the same fields.
- Form Layout Modifiers: If the assigned_to or urgency fields are moved from the main layout view, ensure these scripts remain active and scoped properly.

3. onLoad Client Script

An onLoad Client Script runs when a form is opened. It can be used to set default values, hide fields, or perform actions when the form initially loads.

4. onChange Client Script

An onChange Client Script runs when the value of a particular field changes. It is useful for dynamically updating other fields based on the user's selection.

7. onSubmit Client Script

An onSubmit Client Script runs when a user tries to submit a form. It can validate the entered information and prevent submission when required conditions are not satisfied.
